

AWS Cloud Practitioner Training

Day 3 Review

Instructor: Tim Platt, Cloud Solution Architect

What does “VPC” Stand for?

- A. Virtual Private Connection
- B. Virtual PC Controller
- C. Virtual Private Cloud
- D. Visual Process Condition

What does “VPC” Stand for?

- A. Virtual Private Connection
- B. Virtual PC Controller
- C. Virtual Private Cloud
- D. Visual Process Condition

Which of the following allows us to control the flow of information in our virtual network (VPC)?

- A. Route 53
- B. SSM
- C. Route Tables
- D. EC2

Which of the following allows us to control the flow of information in our virtual network (VPC)?

- A. Route 53
- B. SSM
- C. Route Tables
- D. EC2

Which of these implement FIREWALL rules allowing us to control the flow of traffic IN and OUT of our VPC? (SELECT 2)

- A. Security Groups
- B. IAM Policies
- C. Network Access Control Lists
- D. IAM Roles
- E. RDS

Which of these implement FIREWALL rules allowing us to control the flow of traffic IN and OUT of our VPC? (SELECT 2)

- A. Security Groups
- B. IAM Policies
- C. Network Access Control Lists
- D. IAM Roles
- E. RDS

Which TWO statements are accurate regarding Public versus Private subnets?

- A. Put Internet-facing resources (like web servers) into a Private Subnet so they can be reached by Internet users.
- B. Put resources like databases that should only ever be accessed internally in Private subnets
- C. Put Internet-facing resources (like web servers) into a Public Subnet so they can be reached by Internet users.
- D. Put resources like databases that should only ever be accessed internally in Public subnets

Which TWO statements are accurate regarding Public versus Private subnets?

- A. Put Internet-facing resources (like web servers) into a Private Subnet so they can be reached by Internet users.
- B. Put resources like databases that should only ever be accessed internally in Private subnets
- C. Put Internet-facing resources (like web servers) into a Public Subnet so they can be reached by Internet users.
- D. Put resources like databases that should only ever be accessed internally in Public subnets

Which network resource allows servers in Private subnets to have safe, controlled, outbound access to the Internet (For downloading patches or other files)?

- A. Internet Gateway
- B. VPC Peering Connection
- C. NAT Gateway
- D. Security Groups

Which network resource allows servers in Private subnets to have safe, controlled, outbound access to the Internet (For downloading patches or other files)?

- A. Internet Gateway
- B. VPC Peering Connection
- C. NAT Gateway
- D. Security Groups

Which AWS Service handles Name Resolution (DNS – changing friendly names like www.amazon.com into an IP address?

- A. RDS
- B. VPC
- C. Route Tables
- D. Route 53

Which AWS Service handles Name Resolution (DNS – changing friendly names like www.amazon.com into an IP address?

- A. RDS
- B. VPC
- C. Route Tables
- D. Route 53

**If want to connect my VPC in Oregon with my VPC in Ohio
– so the servers could talk. What would I use?**

- A. VPC Peering Connection (PCX)
- B. Network ACL
- C. Route 53
- D. Security Group

If want to connect my VPC in Oregon with my VPC in Ohio – so the servers could talk. What would I use?

- A. VPC Peering Connection (PCX)
- B. Network ACL
- C. Route 53
- D. Security Group

Which of the following IS NOT a database option in RDS?

- A. IBM DB2
- B. Oracle
- C. Microsoft Sql Server
- D. Aurora
- E. MySQL
- F. Postgresql
- G. Sqlite
- H. MariaDB

Which of the following IS NOT a database option in RDS?

- A. IBM DB2
- B. Oracle
- C. Microsoft Sql Server
- D. Aurora
- E. MySQL
- F. Postgresql
- G. Sqlite
- H. MariaDB

How many Availability Zones does a Multi-AZ database instance use?

- A. 1
- B. 2
- C. 3
- D. 12

How many Availability Zones does a Multi-AZ database instance use?

- A. 1
- B. 2
- C. 3
- D. 12

TRUE or FALSE?

By having a Primary database node in one AZ we can send all updates to the Standby database node in a DIFFERNT AZ and ensure that the Standby can take over for the primary with a complete copy of the current data in case the Primary has an issue.

A. TRUE

B. FALSE

TRUE or FALSE?

By having a Primary database node in one AZ we can send all updates to the Standby database node in a DIFFERNT AZ and ensure that the Standby can take over for the primary with a complete copy of the current data in case the Primary has an issue.

A. TRUE

B. FALSE

Did you have fun?

A. Yes

B. Yes !!!!

C. No
